"Effect of Temperature and Superhigh Frequency on the Conductivity of Germanium
with Beryllium at Helium Temperatures"

Leningrad, Fizika i Tekhnika Poluprovodnikov, Vol 4, No. 9, Sep 70, pp 1683-1688

Abstract: The authors investigate the temperature dependence of conductivity (σ') and the effect of superhigh frequency ($\lambda = 3 \text{ cm}$) on σ' in P-type germanium doped with beryllium and phosphorus at $1.45-4.2^\circ\text{K}$. In this region the relationship $\sigma'(T)$ may be approximated by the formula $\sigma' = \sigma'_0 \exp(-E/kT)$. Both σ' and σ'_0 are studied as functions of $r_A = [3/4\pi(2N_{\text{Be}} - N_p)]^{1/3}$ (N_{Be} and N_p are the concentrations of beryllium and phosphorus). With a reduction in r_A , σ' decreases, disappearing when $r_A = 40-50 \text{ \AA}$. Within the limits of measurement precision, the relationship $\sigma'_0(r_A)$ may be represented by the expression $\sigma'_0 = C \exp(-2r_A/a_2)$, where $C \approx 3 \cdot 10^3 \text{ S}^{-1} \cdot \text{cm}^{-1}$, and $a_2 \approx 17 \text{ \AA}$. An increase in $\sigma'(\Delta\sigma')$ was observed which was proportional to the SHF power. In the linear region of voltage-current characteristics, $\Delta\sigma'$ is independent of the amplitude of the DC field, and $\Delta\sigma'/\sigma'$ changes by only an order of magnitude with a change in σ' by seven orders of magnitude. The relationship

USSR

VAVILOV, V. S., et al., *Fizika i Tekhnika Poluprovodnikov*, Vol 4, No 9, Sep 70, pp 1683-1688

between $\Delta\sigma'$ and the SHF modulation frequency is studied. In low-resistance specimens, $\Delta\sigma'$ decreases by half when $f = 30$ kHz. This inertness indicates that $\Delta\sigma'$ is chiefly bolometric in nature. The authors thank V. L. Bonch-Bruyevich and N. A. Penin for interest in the work and for discussing it, T. Yu. Lisovskaya for assisting with the experiment, and V. Ye. Kuvshinova for preparing the specimens and carrying out the Hall measurements.

"Grids of Dislocations Formed During Growth and Annealing in Base Plane of
Zinc Single Crystals"

Moscow, Kristallografiya, Vol 18, No 2, Mar-Apr 73, pp 418-420.

Abstract: Primary attention in this work is given to the study of the nature of the dislocations and determination both of Burger's vectors b and direction vectors d_1 of segments of dislocation grids. Studies were performed using a GEM-100V electron microscope at 100 kv accelerator voltage. Analysis of the pictures produced showed that the dislocation grids consist mainly of mixed dislocations. Over 20 grids were studied and in all cases it was found that the orientation of segments of dislocations was near edge orientation. This fact might be related to the process of preparation of specimens, since dislocation structures of helical segments might easily break down in the thin foil due to transverse slipping, while nonconservative motion is required for projection of edge segments from the plane of the grid.

"Experimental Investigations of Double-Curvature Slanting Shells with Supported Edge Elements"

Tallin, Tr. Tallin. politekhn. in-ta (Transactions of the Tallin Polytechnic Institute), No 333, 1972, pp 57-66 (English abstract) (from Referativnyy Zhurnal -- Mekhanika, No 4, 1973, Abstract No 4V233)

Translation: Slanting shells of positive Gaussian curvature with sides at right angles are considered. The longitudinal edge elements of the shell were supported during the experiment. The experimental investigations were conducted on a series of models (120x60cm) of a reinforced cement solution 1:25. Stress-strain curves of internal forces, transport values and schemes of crack formation are presented. The collapse of all models was a result of the formation of a plastic articulation of positive bending moments at the edge element with a load greater than 1400-1800 kg/m². (Author's abstract)

"The Effect of Restricted Muscular Activity (Hypodynamia) on Total Cholesterol and Lipoprotein Levels in the Blood"

Moscow, Byulleten' Eksperimental'noy Biologii i Meditsiny, No 5, 1970, pp 34-35

Translation: Ten days after restricting the movements of rabbits, blood cholesterol decreased (from 81 ± 1.43 to 63 ± 7.7 mg%), but then increased sharply after 30 days (to 176 ± 15.08 mg%). Two weeks after restricting the animals' movements, the content of alpha-lipoproteins decreased almost threefold (from 19.97 ± 2.48 to 6.97 ± 0.82 %), while that of beta-lipoproteins increased (from 46.23 ± 1.45 to 56.99 ± 0.53).

Total cholesterol and lipoprotein levels were investigated in the blood of rabbits whose movements were sharply restricted, i.e., under conditions that induce atherosclerosis and coronary insufficiency without the injection of exogenous cholesterol.

Procedure

1/3 Total blood cholesterol was determined by M. A. Levchenko's method. Paper

USSR

TYAVOKIN, V. V., Byulleten' Eksperimental'noy Biologii i Meditsiny, No 5, 1970,
pp 34-35

electrophoresis in an EFA-1 was used to investigate the serum lipoproteins. Serum was stained beforehand with Sudan black, and applied in an amount of 0.04 ml to paper strips 3.5 cm wide and 26 cm long. Electrophoresis continued for 4 hours with current of 0.5 ma per cm of strip width at a voltage of 200 v. Quantitative determination of the fractions was done by photocolorimetry after elution of the lipoprotein spots with a solution of 20% acetic acid in 80% alcohol.

Results

Total blood cholesterol was determined in 48 rabbits (32 experimental animals and 16 controls). Just before restriction of the animals' movements, serum cholesterol amounted to 81 ± 1.43 mg%. Twenty-four hours later it was 75 ± 8.85 mg% ($P > 0.2$); 5 days later, 89 ± 9.6 mg% ($P > 0.2$); 10 days later, 63 ± 7.7 mg% ($P < 0.015$); 15 days later, 82 ± 9.6 mg%; 30 days later, 176 ± 15.08 mg% ($P < 0.001$); and 140 days later, 161 ± 27.3 mg% ($P < 0.015$). Consequently, 10 days after restriction of the animals' movements, the blood cholesterol level dropped, but it rose substantially after 30 days.

Fluctuations in the average blood cholesterol level during the first two weeks of restricted movements are noteworthy. They are even more striking when the cholesterol level in each experimental animal is considered separately. Before
2/3

USSR

TYAVOKIN, V. V., Byulleten' Eksperimental'noy Biologii i Meditsiny, No 5, 1970,
pp 34-35

the cholesterol level dropped most of the rabbits exhibited a phase of increase, usually 1-5 days after movements were restricted. The level dropped in some of the animals without a preliminary increase phase.

Serum proteins were investigated dynamically in 17 rabbits.

Dynamics of Lipoproteins (in %) in the Serum of Rabbits After
Restriction of Movements ($M+m$)

Index	Before limita- tion of move- ments	7 days after restriction of movements	P	14 days after restriction of movements	P
α -lipoproteins	19.97 \pm 2.48	8.21 \pm 0.76	< 0.001	6.97 \pm 0.82	< 0.001
β -lipoproteins	46.23 \pm 1.45	56.99 \pm 0.5	< 0.001	53.8 \pm 1.75	< 0.004
Lipid residue	33.79 \pm 1.87	34.79 \pm 1.5	> 0.3	39.21 \pm 1.9	< 0.03

It is evident from the table that the content of alpha-lipoproteins decreased almost threefold, while that of beta-lipoproteins increased substantially. No statistically significant increase in the lipid residue occurred until 14 days after restriction of movements.

"Study of a Combined Vaccine Against Brucellosis and Anthrax in Sheep"

Moscow, Veterinariya, No 7, 1970, pp 38-40

Abstract: A combined dry vaccine against brucellosis and anthrax was prepared from standard strains No. 19 and STI-1 of *Brucella* and *B. anthracis*, respectively. Guinea pigs and sheep were immunized with vaccine containing the two antigens in a ratio corresponding to that which would be used in separate administration of monovaccines against the two diseases. Intensive immunity to infection with virulent strains of *Br. melitensis* and *B. anthracis* developed, indicating an absence of mutual interference between the two antigens. Administration of the combined vaccine to sheep produced immunity to anthrax that lasted for more than 2 years and immunity to brucellosis for up to 17 months.

"New Data in the Study of Chemoreception and Osmoreception"

Kiev, Vrachebnoye Delo, No 2, 1970, pp 96-100

Abstract: A study was made to detect the electrophysiological indications of sinocarotid zone sensitivity of dogs to glucose and sodium chloride as stimuli of different chemical nature, but under conditions of equal osmotic action. Moreover, by administration of hypertonic solutions of glucose and sodium chloride to one and the same animal, either into the right common carotid artery, or into the left one, with synchronous recording of the start of bioelectrical activation of both sinus nerves simultaneously, it was possible to determine the interrelation in functional activity of the pair of reflexogenic zones.

Two series of experiments were conducted and oscillograms indicating the results are presented. One set of four oscillograms shows shifts in the sinus nerve bioelectrical activity upon administration of various percentages of hypertonic solutions of glucose and sodium chloride into the common carotid artery. Analysis of the oscillograms indicated that bioelectrical activation of the sinus nerve upon administration of sodium chloride solutions was delayed as compared 1/2

USSR

TYCHININ, V. A., Vrachebnoye Delo, No 2, 1970, pp 96-100

with administrations of glucose. Another set of four oscillograms shows the bioelectrical activity of the right and left sinus nerves upon administration of a 40% glucose solution into the right or left common carotid artery. A third set of four oscillograms shows the bioelectrical activity of the right and left sinus nerves upon administration of a 5.73% sodium chloride solution into the right or left common carotid artery. Results of experiments and analysis of oscillograms determined that the chemically specific characteristics of the stimuli are significant in the genesis of interoceptive functions of the carotid reflexogenic zone during identical "osmotic stimulation" of its receptor apparatuses.

"Amplified Magnetostatic Echo"

Moscow, Radiotekhnika i Elektronika, Vol 17, No 4, Apr 72, pp 781-786

Abstract: The paper outlines the theory of the amplified magnetostatic echo. The analysis is based on examination of a system of nonlinearly interacting modes of magnetostatic oscillations with regard to relaxation processes. The curve for the amplification factor as a function of the interpulse spacing is studied in detail. It is shown that this curve may have a maximum determined by competing processes of amplification and relaxation. The theoretical results agree satisfactorily with experimental data.

"Program-controlled Machine for Gas-laser Cutting of Sheet Materials"

Moscow, Svarochnoye Proizvodstvo, No 4, Apr 72, pp 52-53.

Abstract: The Institute has developed a machine for cutting of alloy steels, titanium and other materials using carbon-dioxide lasers, allowing any contour to be cut in the tracking mode. Contour control of the machine is by a digital programmed device using punch tape. The machine has been tested using various materials including 1-10 mm sheets of low-carbon and alloy steels of various types. Good cutting accuracy has been achieved: parts have been cut from sheets up to 3 mm thick, with smooth, even edges, and very small zone of thermal effect near the cut. Cuts are very thin (a few tenths of a millimeter).

"Calculation of the Characteristics of Different Structural Combinations of Linear Transitional Systems"

Tr. Mosk. Aviats. In-ta (Works of the Moscow Aviation Institute), No 240, 1972,
pp 116-122 (from Referativnyy Zhurnal--Raketostroyeniye, No 5, May 73, Abstract
No 5.141.143 by the authors)

Abstract: As is known, the transfer function of a linear transitional system is the natural expansion of the concept of the transfer function of a steady system, but in contrast to a steady system a transitional system generally cannot be obtained with the aid of a finite number of operations on the coefficient of dynamics equations. Methods of finding transfer functions of different structural combinations (except parallel), done for steady systems, cannot be used for transitional system. This article was devoted to the problem of finding approximate analytical expressions of transfer functions for different combinations of linear transitional systems. It is assumed that the given and sought for transfer functions can be approximately expressed in the form:

$$W_1(s,t) = \frac{s_{1,0}(t)s^{q-1} + \dots + c_{1q-1}(t)}{s^q + d_{1,1}(t)s^{q-1} + \dots + d_{1q}(t)}$$

where i--index of chain or combination; c_{ij} , $j = 0\dots, q-1$, d_{ij} , $j = 1\dots, q$ --real coefficients, s--complex variable. The problem is reduced to finding formulas which express the coefficients of transfer coefficients of combinations through the coefficients of transfer functions for chains. Since solution of this problem depends on the proposed degree of the polynomial of the transfer function denominator, then it is necessary to assign the indicated degree to obtain a single-value solution. The variant of solution is examined for the case when the polynomial degree of the transfer function denominator of a combination is determined via the polynomial degree of transfer function denominators of chains by the same rules which pertain to the theory of steady systems. 1 figure, 1 bibliographic reference.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. IT IS KNOWN THAT THE HEAT RESISTANT PROPERTIES OF AUSTENITIC CHROME NICKEL STEELS OF THE TYPE OF 18CR-12NI, STABILIZED BY TITANIUM OR NIOBIUM, ARE DETERMINED PRINCIPALLY BY THE HEAT TREATMENT REGIME. A RISE IN THE HEAT TREATMENT TEMPERATURE IS ACCCOMPANIED, AS A RULE, BY AN INCREASE OF THE TIME PRIOR TO DESTRUCTION, BUT BRINGS ABOUT A DECREASE IN LONG TERM PLASTICITY. IN THIS CONNECTION THERE ARE REASONS TO SUSPECT THAT THE USE OF HIGH TEMPERATURE HEAT TREATMENT AT 1190-1200DEGREESC AT PIPE PLANTS FOR BOILER PIPES MADE OF STEEL KH18NI2T WILL PROMOTE EXCESSIVE BRITTLENESS IN STEAM SUPERHEATER PIPES. THE HIGH TEMPERATURE HEAT TREATMENT REGIMES OF COLD ROLLED PIPES OF STEEL KHL8NI2T THAT ARE PRESENTLY EMPLOYED ARE DETERMINED BY THE NECESSITY OF OBTAINING, IN THE PIPES, THE AUSTENITE GRAIN SIZE STIPULATED IN THE TECHNICAL SPECIFICATIONS AND BY THE STRIVING OF PIPE PLANTS TO REDUCE THE LENGTH OF THE HEAT TREATMENT CYCLE. THE HEAT RESISTANT PROPERTIES OF THE PIPE METAL ARE NOT TAKEN INTO ACCOUNT IN SELECTING THE HEAT TREATMENT REGIME. IN THIS CONNECTION, RESEARCH WAS UNDERTAKEN ON THE EFFECT OF THE HEAT TREATMENT REGIME ON THE HEAT RESISTANT PROPERTIES OF PIPE METAL FROM STEEL KH18NI2T. SELECTED FOR INVESTIGATION WERE COLD ROLLED PIPES 32 TIMES 6 MM IN SIZE, FROM FOUR MELTS WHICH DIFFERED IN THE CONTENT OF CARBON AND TITANIUM. IT WAS FOUND THAT THE METAL OF COLD ROLLED PIPES FROM STEEL KH18NI2T FROM DIFFERENT MELTS, AFTER HEAT TREATMENT UNDER IDENTICAL CONDITIONS, DIFFERED SUBSTANTIALLY WITH RESPECT TO HEAT RESISTANT PROPERTIES AT 650DEGREESC.

"On Chrome Plating of Embedded Parts in Reinforced Concrete
Structures"

Moscow, Beton i Zhelezobeton, No. 4, April, 1971, pp 26-28

Abstract: One of the effective means to prevent corrosion
is chrome plating, especially the one deposited by the
vacuum diffusion method. This method consists of keeping
the parts for four hours in a vacuum furnace at 1300°C.

The steel treated by this method loses some of its
strength unless it is subsequently normalized.

1/2

USSR

PONOMARENKO, E. P., et al, Beton i Zhelezobeton, No 4, April 1971, pp 26-28

Welding of the chrome plated parts with stainless electrodes does not destroy the chrome plating.

Tests with nitric acid showed that the corrosion resistance of chrome plated specimens equals that of chrome-nickel steel.

Use on chrome plated parts for the prefabricated building panels results in considerable savings over the galvanizing method.

"The Effect of Thermomechanical Treatment on the Impact Ductility, Crack
Propagation, and Disintegration Viscosity"

Dnepropetrovsk, Metallurgicheskaya i Gornorudnaya Promyshlennost', No 4(82),
Jul-Aug 73, p 32

Abstract: Results are presented of an investigation of the mechanical properties of 14Kh2GMR steel after the usual heat treated and after high-temperature thermomechanical treatment (HTMT). Tabulated reppoint, relative elongation, relative contraction, fatigue limit, and impact ductility at various temperatures. HTMT was found to somewhat increase the strength characteristics of the steel. HTMT does not lower the plasticity, it substantially increases the impact strength at the expense of the increasing share of the work of crack propagation. The increase of structural strength of 14Kh2GMR steel by HTMT lasts up to a 650° C temper temperature. The creation of a stable substructure by hardening increases the resistance of the steel to brittle failure and decreases its susceptibility to stress concentrations. Two tables, four bibliographic references,

"Fatigue Strength of the Welded Beam Support Subassembly of Overhead Travelling
Cranes at Minus Temperatures"

Moscow, Vestnik Mashinostroyeniya, No 4, Apr 73, pp 16-19

Abstract: The authors determine the effect of low temperatures on the fatigue strength of the support subassemblies of welded metal structures with sharply varying cross sections. The jib of a 20-ton series produced travelling crane is studied. The beam is made from St3 grade steel and welded with the E42A electrodes. The bent sheet of the bottom band is welded to the vertical wall by a bilateral angular seam (10 mm fillet). Tests were conducted at +20 and -40°C on a hydraulic-pulsed testing machine including refrigeration equipment. The fatigue limits for the full scale beams of a travelling crane are determined by the interpolation method and are $\sigma=13.4 \text{ kg/mm}^2$ for +20°C and $\sigma=11.3 \text{ kg/mm}^2$ for -40°C.

"Investigation of Carbon Solubility in Mo+45%Re Alloy"

Ordzhonikidze, Izvestiya Vysshikh Uchebnykh Zavedeniy,
Tsvetnaya Metallurgiya, No 6, 1973, pp 125-129

Abstract: The solubility of C in the Mo+45%Re alloy was investigated by measuring the electric resistance. The derived experimental data show that the solubility of C in the Mo+45%Re alloy comprises 0.035% at 1550° and that it comes up to 0.05% at 1800°. In the presence of 45%Re, the solubility of C in Mo rises 25% at 1800° and 75% at 1550°. The presence of 0.035%C in the solid solution increases the electric resistance ρ of the alloy by $7.5 \mu\Omega \cdot \text{cm}$; the presence of carbides in the alloy at a C content up to 0.265% has no noticeable influence on the level of its ρ . The temperature coefficient of ρ of Mo+45%Re alloy can be considered nearly constant and equal to $2.9 \cdot 10^{-3} \mu\Omega \cdot \text{cm} \cdot \text{deg}^{-1}$; it decreases at transition into the 0.035%C solid solution. The ρ -curve of the Mo+45%Re+0.4%C alloy shows a break at 1250-1260°. Three figures, one table, 11 bibliographic references.

"Ternary Sigma- and Chi-Phases in the Ta-Nb-Re System"

Moscow, Izvestiya Akademii Nauk SSSR, Metallofizika, No 1, Jan/Feb 74, pp 229-233

Abstract: The structure and certain physical and mechanical properties of sigma- and chi-phases in the ternary system Ta-Nb-Re were investigated, where it was found that this system is characterized by a large region of ternary solid solutions of Re in Ta and Nb, low solubility of Ta and Nb in Re, and the formation of two compounds of the sigma- and chi-phase type where the sigma-phase exists only at high temperatures, being decomposed into the alpha-solid solution and chi-phase. Lattice parameters, melting points, hardness, resistivity, and transition temperature to the superconducting state were determined for the sigma- and chi-phases. Alloy composition and transition temperatures are given for alloys with a constant Re content (approximately 71%), for the binary chi-phase (Re_3Nb) and the binary chi-phase. The transition temperature to the superconducting state of ternary chi-phases was 1.5-2 times higher than the transition temperature for binary chi-phases in Nb-Re and Ta-Re systems. Two figures, one table, seven bibliographic references.

"Some Physical Properties of a New Alloy in the Nickel-Rhenium-Molybdenum
System"

Moscow, Teplofizika Vysokikh Temperatur, Vol 11, No 2, Mar/Apr 73, pp
435-436

Abstract: The authors study the heat conduction, coefficient of thermal expansion and resistivity of an alloy in the nickel-rhenium-molybdenum system containing 10 wt.% Re and 15 wt.% Mo. Curves are given showing the temperature dependence of the measured parameters between 100 and 1000°C. The results indicate structural transformation of the alloy in the solid state. Analysis points to the possibility of formation of the so-called K-state observed in the region of solid solutions of the nickel-chromium system with more than 16% chromium. However, a final explanation of the observed anomalies will require further research.

"Metrologic Verification of the State of Measuring Gamma-Radiation Doses in the $1 \cdot 10^3$ - $10 \cdot 10^8$ Rad Interval With Liquid Chemical Detectors"

V sb. Dozimetriya i radiats. protsessy v dozimetr. sistemakh (Dosimetry and Radiation Processes in Dosimetric Systems -- collection of works), Tashkent, "Fan", 1972, pp 100-103 (from RZh-32.Metrologiya i Izmeritel'naya Tekhnika, No 5, 1973, Abstract No 5.32.1321)

Translation: The metrologic verification of the state of measuring gamma-radiation doses in the $1 \cdot 10^3$ - $10 \cdot 10^8$ rad interval with liquid chemical detectors showed that nearly one fourth of the digital values of an exposure dose diverge with the assigned value to magnitudes which exceed the measurement error. The number of overestimated results is nearly twice that of the underestimated. This attests to the presence of systematic error. Ways of improving the state of measuring gamma-radiation doses are indicated. Original article: one illustration and one table.

"Estimating the Carrying Capacity of a Hydroacoustic Channel Affected by Non-stationary Reverberation Noise"

Kiev, Otdor i Peredacha Informatsii, No 29, 1971, pp 27-30

Abstract: A study was made of the possibility of improving the efficiency in remote control systems using a hydroacoustic communications channel. The non-stationary component of the reverberation noise affecting such a channel was taken as the factor limiting its carrying capacity. The carrying capacity of the channel is described mathematically. Its carrying capacity can be increased with a decrease in the pulse duration at the reception point. The possibility of practical implementation of this condition is discussed briefly. An experimentally obtained envelope of a pulse train obtained by linear summation with a time shift of an isolated signal of the 6-pulse type distorted on passage through the hydroacoustic channel is compared with the envelopes of the same pulse train first passed through a high-frequency filter.

"Efficient Coding of a Signal Transmitted over a Hydroacoustic Channel
Affected by Reverberation Noise"

Kiev, Otdor i Peredacha Informatsii, No 29, 1971, pp 24-26

Abstract: A study was made of the possibility of improving high-speed digital remote control systems using hydroacoustic communications channels. The conditions are presented for obtaining the optimal binary code by pulses of the detonation type and a multiposition code by frequency pulses.

A sample calculation is made showing that because of the deterministic restrictions imposed on the possibility of using each frequency dispatch it is possible, by using a code with "floating frequencies," to develop a higher data transmission speed under reverberation conditions than with an ordinary multifrequency code.

Practical implementation of such a code presents no difficulties.

"Viscosity of Optical Glasses"

Leningrad, Zhurnal Prikladnoy Khimii, Vol 43, No 6, Jun 70, pp 1218-1225

Abstract: The viscosity η of 120 grades of glass ($\eta = 10^2 - 10^{13}$ poises) in relation to the temperature was determined. The results are listed in tables showing values of $\lg \eta$ for various temperatures t . The values included in the tables were obtained in part by interpolation and extrapolation of experimental values to cover the complete $\eta = 10^1 - 10^{16}$ poises range ($t = 312-2010^\circ$). Determinations at $10^4 - 10^{13}$ poises were carried out by the method of pressing in described earlier, those at $10^1 - 10^4$ poises by means of GOI automatic rotational viscosimeters. Measurements of η carried out by the first method on glass No 710 of the USA National Bureau of Standards led to results which coincided with those reported by A. Napolitano and E. G. Hawkins, J. Res. Nat. Bur. Stand., A. Phys. a. Ch., 68A, 439, 1964. The rotational viscosimeters were calibrated at $10^2 - 10^4$ poises on the basis of values reported for glass No 710. Data obtained for B_2O_3 by means of these viscosimeters agreed with those reported in the literature. A glass with the composition SiO_2 69.60, B_2O_3 11.09, Al_2O_3 2.00, As_2O_3 0.10, BaO 0.65, CaO 1.37,

"Algorithm for Optimizing the System Comprised of Main Administrative Board and Enterprise"

Kiev, Prom. kibernetika--sbornik (Industrial Cybernetics--collection of works), 1971, pp 40-50 (from RZh-Kibernetika, No 10, Oct 72, abstract No 10V598 by G. Tkachenko)

Translation: The paper deals with the problem of selecting optimum control strategy in a system made up of a main administrative board and an enterprise. This strategy should optimize both the jobs which are common to the entire system, and jobs which arise in individual links of the system. It is proposed that the problem of optimizing the activity of a production union be represented in the form of a set of separate problems to be solved in a certain sequence. The strong dependence on natural conditions dictated the use of a games approach.

"Analysis of the Accuracy of Analog-to-Digital Transformation with Automatic
Exclusion of Systematic Errors"

Pribory i sistemy avtomatiki. Resp. mezhvud. temat. nauch.-tekhn. sb. (Auto-
mation Instruments and Systems. Republic Interdepartmental Thematic Scientific
and Technical Collection), 1972, vyp. 24, pp 103-107 (from RZh-Kibernetika, No
12, Dec 72, Abstract No 12V452)

Translation: A study was made of the method of analog-to-digital transforma-
tion which can be realized in information-measuring devices. For a significant
reduction (exclusion) of systematic measurement errors, an information channel
is introduced into the block diagram of the converter which permits the code
of a standard value in its physical essence an adequate unknown, to be received.
On the basis of the analysis of the accuracy of the proposed method of analog-
digital transformation, recommendations are made for selection of the optimal
ratio of the unknown and the standard variables.

"Role of Circadian Processes in Insect Photoperiodism"

Moscow, Zhurnal Obshchey Biologii, No 1, 1972, pp 21-31

Abstract: Light and dark circadian processes participate in the photoperiodic reactions of insects. Their absolute durations are specific for each species and geographic population. The length of day and night is measured by mutual phasing of these processes under the influence of the photoperiod. This system permits only a qualitative estimate (shorter or longer than the inborn standard) and thus operates on the principle of a binary code. The photoperiodic measurement of time is attuned ecologically. Temperature and other environmental factors may exert a corrective influence on the operation of the system by adapting the mechanism of the photoperiodic reaction to the different seasons. The transmission of information from the oscillatory apparatus that judges the length of day and night to the endocrine system that controls insect development and diapause is apparently mediated by a photoperiodic counter that sums the number of short and long days throughout the period of larval development.

"Nervous Regulation of the Circadian Rhythm of Motor Activity in the Cricket *Gryllus domesticus* L. (Orthoptera, Gryllidae)"

Leningrad, Entomologicheskoye Obozreniye, No 1, 1970, pp 72-82.

Abstract: The house cricket is most active at night. The circadian rhythm of its activity is approximately 26 hours with continuous light and 22 hours with constant darkness. Electrothermocautery of portions of the brain showed that the circadian rhythm disappeared only when one of the points of two definite zones in the protocerebrum (situated symmetrically to the right and left of the median line of the brain) was cauterized. A ligature applied between the head and thorax of the insect prevented the passage of hormones from the neurosecretory cells to the body, indicating that the circadian rhythm is regulated by neurons rather than hormones. The mechanism of synchronization of the cricket's behavioral rhythms seems to be the following. The rhythms are controlled by brain neurons attuned to the photoperiod. The light conditions synchronize these neurons. The circadian rhythms of the brain neurons are synchronite, in turn, the neurons of the thoracic 1/2

"Testing the Water Permeability of Concrete in Thin-Walled Reinforced Concrete Structures"

Gidrotekhnika I Melioratsiya, No 8, 1970, Pages 49-52

Abstract: The existing method for testing water permeability of concrete (All-Union State Standard GOST 4800-59) allows permeability to be determined only in large, monolithic structures. This article suggests a method allowing the actual permeability of concrete to be established in thin-walled products 5-10 cm thick. The method uses the structures themselves or sample slabs of the same thickness, exposing them to one-sided water pressure for a fixed period of time. The apparatus used is diagrammed. Field tests were performed in 1968, indicating satisfactory operation of the equipment.

"Spectral Determination of Impurities in Various Aluminum Oxides"

Moscow, Zavodskaya Laboratoriya, Vol 36, No 11, 1970, pp 1347-1348

Abstract: A direct spectral method is outlined for determining a number of impurities in aluminum hydroxide and in items made from it at high-temperature hardening. The method involves placing samples in carbon electrodes 5 mm deep and 4 mm in diameter and exciting them by a dc arc with $i = 14a$ for 120 sec. A mixture of oxides of the unknown elements with pure alumo-ammonium alums, which at subsequent hardening are transformed into aluminum oxide, are used as standards. A description is given of the preparation of standards containing 1% of every unknown element and others with decreasing content, as well as samples of aluminum hydroxide. The sample and standard spectra were photographed by the ISP-28 spectrograph with 1.2 micro slots. Diagrams in ΔS ; $\lg C$ coordinates were constructed for 1/2

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE AUTHOR USED A TEFLON VASCULAR PROSTHESIS TO FULLY OCCLUDE THE PYLORUS IN 12 DOGS. THE ANIMALS LIVED AFTER OPERATION FOR 3-6 DAYS. FOUR DOGS DEVELOPED TYPICAL TONIC CRAMPS OF THE EXTREMITIES, MUSCULAR TREMORS WERE SEEN IN ALMOST ALL THE DOGS. BIOCHEMICAL BLOOD CHANGES CONSISTED IN A DECREASE OF POTASSIUM IN PLASMA AND ERYTHROCYTES AND OF SODIUM IN PLASMA; AT THE SAME TIME THE SODIUM TITER IN ERYTHROCYTES ROSE. CALCIUM AND MAGNESI IN PLASMA INCREASED. HYPOCHLOREMIA, AZOTEMIA AND ALCALOSIS WERE SEEN IN ALL THE ANIMALS.

"Organophosphorus Compounds. III. α -Diarylphosphinyl Substituted Benzyl
Alcohols"

Leningrad, Zhurnal Obshchey Khimii, Vol 43 (105), No 5, May 73, pp 997-1000

Abstract: Several α -diarylphosphinyl substituted benzyl alcohols have been synthesized by addition of bromomagnesium salt of diphenylphosphine oxide, chloromagnesium salt of dibenzylphosphine oxide, and bromomagnesium salt of di-1-naphthylphosphine oxide to substituted benzaldehydes and acetophenone. When three moles of α -naphthylmagnesium bromide are added to one mole of di-n-butylphosphonate followed by hydrolysis of the Grignard complex, the product is the oxide of di-1-naphthylphosphine. The reactions were carried out in anhydrous benzene at room temperature or with slight heating. The products were identified by IR and NMR spectroscopy.

"Study of Formation of Neutron Beams From Isotope Neutron Sources"

Tr. VNII Radiats. Tekhn. (Works of All-Union Scientific Research Institute for Radiation Equipment), No 5, 1970, pp 98-103 (from Referativnyy Zhurnal-Yadernyye Reaktor, No 3, 1971, Abstract No 3.50.75)

Translation: Experimental studies were performed into the influence of individual factors on beam characteristics. The measurements were performed in a water tank (1000 mm diameter, 1200 mm high) with two sources (Pu^{238} + Be and Cf^{252}), having different fast-neutron energy spectra. In order to reduce the perturbations of the neutron flux, the source and collimator holders were made of organic glass, while the collimators themselves were made of paper soaked in paraffin or of steel pipe with a wall thickness of 0.1 mm. Neutron flux measurements were performed using indium foils as well as a scintillation counter with an LiI (Eu) single crystal enriched to 90% Li^6 (crystal diameter 30 mm, thickness 4.4 mm). 4 figures, 8 biblio. refs.

"Spectral Characteristics of Neutron Sources Based on Pu²³⁸,"

Prikl. Yadern. Spektroskopiyu (Applied Nuclear Spectroscopy -- collection of works), No 1, Moscow, Atomizdat Press 1970, pp 24-27 (from Referativnyy Zhurnal-Yadernyye Reaktory, No 3, 1971, Abstract No 3.50.138)

Translation: A single-crystal fast neutron scintillation spectrometer was used in combination with a 512-channel amplitude analyzer to measure the spectra; discrimination of the γ background was based on the time of scintillation of a stilbene crystal. The spectrometer was calibrated for the γ radiation of the isotopes Cs¹³⁷ and Zn⁶⁵. In subtracting the background, the shadow cone from a mixture of paraffin and boron carbide was used. During measurements, the neutron source and detector were placed at a distance of about 2 m from the walls of the room. The results of investigations confirmed the expediency of using Pu²³⁸ to study isotope α sources. The advantages of these

TYUFYAKOV, N. D., et al., Prikl. Yadern. Spektroskopiya, No 1, Moscow, Atomizdat Press 1970, pp 24-27 (from Referativnyy Zhurnal-Yadernyye Reaktory, No 3, 1971, Abstract No 3.50.138)

sources are felt primarily with a yield of 10^7 - 10^8 n/sec $^{-2}$ and more. It is assumed that the production of intermetallic compounds of Pu²³⁸ with the target material allows the yield of neutrons per unit mass of radiator to be increased by several times in comparison with the sources studied. 2 figures, 5 biblio. refs.
